

Given a set of integers,  $S$ , return all possible subsets.

### Notation and terminology

We say that  $S = \langle x_1, x_2, \dots, x_m \rangle$  is a *set*, in which all  $x_i$  are integers and all element placed in non-decending order, that is,  $\langle x_1 \leq x_2 \leq \dots \leq x_m \rangle$ .

We say that  $S'$  is a *subset* of  $S$ , when  $\forall x \in S', x \in S$ .

## 1 Without Duplication

## 2 With Duplication

**Problem.** *Given a set of distinct integers,  $S$ , return all possible subsets.*

*Note Elements in a subset must be in non-descending order.*

*The solution set must not contain duplicate sets.*

**Optimal Substructure.** *Let  $X = \langle x_1, x_2, \dots, x_m \rangle$  be subsequence of  $Y = \langle y_1, y_2, \dots, y_n \rangle$*

1. *if  $x_m = y_n$ , then  $X_{m-1}$  is a subsequence of  $Y_{n-1}$*
2. *if  $x_m \neq y_n$ , then  $X$  is a subsequence of  $Y_{n-1}$*

**Recursive Formula.** *Let us define  $c[i, j]$  to be the length of an longest common subsequence of  $X_i$  and  $Y_j$ . If either  $i = 0$  or  $j = 0$ , one of the sequences has length 0, and so LCS has length 0. Finally, if  $X_m$  is a subsequence of  $Y_n$ ,  $c[m, n] = m$ .*

$$c[i, j] = \begin{cases} 0, & \text{if } i = 0 \text{ or } j = 0, \\ c[i-1, j-1], & \text{if } i, j > 0 \text{ and } x_i = y_j, \\ \max(c[i, j-1], c[i-1, j]), & \text{if } i, j > 0 \text{ and } x_i \neq y_j, \end{cases}$$

*The following table illustrates the constructed  $c[i, j]$  table with  $X$  as “rabbit” and  $Y$  as “rabbbit”. The arrows within will be used in the next section of reconstructing the common sequence.*

| $i$ | $j$   | $0$   | $1$ | $2$ | $3$ | $4$ | $5$ | $6$ | $7$ |
|-----|-------|-------|-----|-----|-----|-----|-----|-----|-----|
|     |       | $y_j$ | $r$ | $a$ | $b$ | $b$ | $b$ | $i$ | $t$ |
| 0   | $x_i$ | 0     | 0   | 0   | 0   | 0   | 0   | 0   | 0   |
| 1   | $r$   | 0     | ↖ 1 | 1   | 1   | 1   | 1   | 1   | 1   |
| 2   | $a$   | 0     | 1   | ↖ 2 | ← 2 | 2   | 2   | 2   | 2   |
| 3   | $b$   | 0     | 1   | 2   | ↖ 3 | ↖ 3 | 3   | 3   | 3   |
| 4   | $b$   | 0     | 1   | 2   | 3   | ↖ 4 | ↖ 4 | 4   | 4   |
| 5   | $i$   | 0     | 1   | 2   | 3   | 4   | ← 4 | 4   | 4   |
| 6   | $t$   | 0     | 1   | 2   | 3   | 4   | 4   | ↖ 5 | 5   |
|     |       | 0     | 1   | 2   | 3   | 4   | 4   | 5   | ↖ 6 |

**Reconstruct Solution.** A distinct subsequence is a distance path from  $c[m, n]$  to  $c[0, 0]$ . For instance, in our case,

1.  $[6, 7] \rightarrow [5, 6] \rightarrow [4, 5] \rightarrow [4, 4] \rightarrow [3, 3] \rightarrow [2, 2] \rightarrow [1, 1] \rightarrow [0, 0]$
2.  $[6, 7] \rightarrow [5, 6] \rightarrow [4, 5] \rightarrow [3, 4] \rightarrow [3, 3] \rightarrow [2, 2] \rightarrow [1, 1] \rightarrow [0, 0]$
3.  $[6, 7] \rightarrow [5, 6] \rightarrow [4, 5] \rightarrow [3, 4] \rightarrow [2, 3] \rightarrow [2, 2] \rightarrow [1, 1] \rightarrow [0, 0]$
